CANNA TERRA

HIGH YIELDS

It's not without reason that experts throughout the world use CANNA TERRA for cultivation. Many see this as the natural cultivation method.

FOR IN- AND OUTDOOR CULTIVATION

The CANNA TERRA range of nutrients has been developed for cul-

tivation both indoors and outdoors. For optimum results CANNA TERRA nutrients should be used in combination with CANNA Terra Professional or CANNA Terra Professional Plus.

QUALITY PROVES ITSELF

CANNA TERRA was the first nutrient on the market that was developed for cultivation in potting mixes. CANNA TERRA remains unequalled due to its revolutionary Terra formula and the high standards that CANNA sets during production.

THE NATURAL METHOD OF CULTIVATION

CANNA's fertilisers have a bio-tropical effect. They are absorbed by the plant's systems in a natural way. CANNA TERRA ensures that there is an optimum balance in the plant

cells, and also increases resistance. In contrast with other fertilisers, TERRA's products are absorbed quickly. This is important for fast-growing plants since the developmental phases follow on after each other very quickly. This high degree of absorbability means that the plant only has to devote a small amount of energy to this process, which enables it to focus completely on growth and flowering.

VERY USER FRIENDLY

CANNA TERRA has different nutrients for growth and flowering. This ensures that the correct doses of nutrients are available for each stage of the plant's development. In addition to this, the composition and dosage of CANNA TERRA is such that new growers will also achieve excellent harvests.

CANNA Terra Vega

Vital side shoots and luxuriant root development are characteristics of healthy, powerful growth and form the basis for a high yield. CANNA Terra Vega has been developed to meet the plant's requirements during the growing phase. Complete absorption of water and feeding from the start of cultivation is also guaranteed because CANNA Terra Vega is rich in nitrogen compounds that can be absorbed directly, high value EDDHA iron chelates and trace elements. CANNA Terra Vega is suitable for use with different type of potting mixes such as pre-fertilised potting mixes or potting mix that is nutrient deficient or has been used previously.

CANNA Terra Flores

The availability and composition of nutrients play a crucial role during the plant's flowering phase. The tendency of potting mix to bind nutritional ions is compensated for by the preparation methods used for CANNA Terra Flores. In addition to this, CANNA Terra Flores is excellent in stimulating the fruit formation and contains all the nutrients that the flowers need during the flowering phase. CANNA Terra Flores is also rich in chelated trace elements that are present in a form that can be absorbed immediately, which guarantees lavish flowering.

CANNA Terra professional and CANNA Terra professional plus

Exclusive, high value organic ingredients such as airy peat moss and types of tree bark that have an antiseptic action are components of CANNA Terra Professional and CANNA Terra Professional Plus. These have the direct result of promoting exceptional root development and the formation of thicker stems, while faster metabolism combined with low sickness rates ensure an increased production. Among other things, these characteristics make CANNA TERRA highly suitable for fast growing plants.

TERRA Seedmix

CANNA Terra Seedmix has a homogeneous, stable structure that ensures it can retain more water, which gives the seeds the best chance of germinating correctly. CANNA Terra Seedmix is also particularly suitable for use when rooting cuttings.
